

ATOMS

Interactive Build Guide

Reusable interaction patterns for visual websites

- 1 Two images → image reveal
- 2 Video → scroll-triggered section
- 3 Video → mouse scrub
- 4 Video → scroll scrub
- + Optional: combine the modules — in any order

HOW THIS GUIDE WORKS

Atoms builds interactive frontend modules from uploaded or generated assets. The modules are reusable building blocks — build one on its own, add one to an existing project, or combine them in any order. Every build first checks the uploaded files and stops if one is missing, instead of inventing a placeholder.

What This Guide Is For

Atoms turns your images and videos into interactive web sections. You drag in a skill file, add a short chat instruction, and the tool writes the HTML, CSS, and JavaScript.

This package includes one PDF guide and five drag-and-drop .prompt.md skill files. Drag a skill file into Atoms, then add your own chat instruction for style, placement, and transitions.

Each module page below gives you what it does, the skill file to drag, what assets you need, and an example chat instruction to paste and tweak.

! Every build checks your uploaded files first. If an asset is missing, it stops and tells you which one — it never swaps in a placeholder.

The Four Modules at a Glance

Four building blocks. Use one on its own, or combine several. Drag the skill file, then add your prompt.

- **1 • Image reveal** — cursor reveals a hidden image. Drag 01-image-reveal.prompt.md · needs two images.
 - **2 • Scroll-triggered video** — one scroll plays a video, then it freezes. Drag 02-scroll-video.prompt.md · needs one video.
 - **3 • Mouse scrub** — mouse position scrubs a video. Drag 03-mouse-scrub.prompt.md · needs one video.
 - **4 • Scroll scrub** — scroll position scrubs a video. Drag 04-scroll-scrub.prompt.md · needs one video.
- ! Build each module on its own first. 05-combined-build.prompt.md (optional) assembles finished modules into one page — use it after the pieces work.**

Module 1 — Image Reveal

Two images are layered. Moving the cursor wipes a soft round window that reveals the image hidden underneath. Uses images, no video.

What you need: two images — a front image and a reveal image (same size and aspect looks best).

Skill file: 01-image-reveal.prompt.md

EXAMPLE CHAT INSTRUCTION

“Use image1 as the front image and Image2 as the reveal image underneath. Keep it cinematic and minimal.”

Module 2 — Scroll-Triggered Video

One downward scroll plays the whole video, then it freezes on the final frame. Scroll triggers playback; it does not scrub the video.

What you need: one video, encoded to play cleanly start to finish.

Skill file: 02-scroll-video.prompt.md

EXAMPLE CHAT INSTRUCTION

“Use Vid1 as a continuation of the hero. On the first scroll, play the video fully and freeze on the final frame.”

Module 3 — Mouse Scrub

A paused video whose frame follows your mouse left and right. It never plays on its own — the cursor scrubs it. Useful when the subject should seem to react to the cursor.

What you need: one video (dense keyframes scrub the cleanest).

Skill file: 03-mouse-scrub.prompt.md

EXAMPLE CHAT INSTRUCTION

“Use Vid4 as a paused mouse scrub. Mouse left/right should control the video frame.”

Module 4 — Scroll Scrub

A paused video whose frame follows scroll progress — scroll down to advance, up to rewind. Continuous scrubbing, not triggered playback.

What you need: one video (dense keyframes scrub the cleanest).

Skill file: 04-scroll-scrub.prompt.md

EXAMPLE CHAT INSTRUCTION

“Use Vid2 as a scroll scrub. Scroll progress should control the video frame smoothly.”

Common Combinations

Mix the modules for the effect you want. These are examples, not rules — build each module on its own first, then combine.

- **1 → 2 → 3** — image reveal hero, then scroll-triggered video, then mouse scrub.
- **1 → 4** — image reveal hero, then scroll-controlled video scrub.

Want a smooth handoff?

Say so in the chat prompt — for example, “fade the hero out before the video starts.” Otherwise the sections are stacked with a simple transition.

- ! Use 05-combined-build.prompt.md to assemble finished modules into one page — only after each module works on its own.**

Assets You Need

Buils use real uploaded files. Keep filenames clear so the right file maps to the right role.

- **Image reveal** — two images (a front image and a reveal image).
- **The three video modules** — one clean video each.

Two ways to get a clip

- **Seedance** — generate a video asset inside the tool — it becomes an upload like any other.
- **Website link** — paste a website link in the chat to borrow its style, layout, or motion as inspiration.

! A generated clip still has to be uploaded — the build only uses files it can find.

Example asset folder — image1, Image2, and Vid1–Vid4.

Team Mode & the Prompt Menu

Team Mode is useful for more advanced, multi-agent work.

! For precise interaction modules, it's often easier to build one module at a time first, then turn on more advanced collaboration once the structure is stable.

The same prompt menu also holds:

- **Attachments** — add your media assets here.
- **Video / Seedance 2.0** — generate video assets directly inside the tool.
- **Connectors** — bring in external context or project sources.

Example prompt menu.
